Rule Set Based Access Control (RSBAC)

Linux Kernel Security Extension

Short Overview for OpenWeekend 2002 in Prague

Amon Ott <ao@rsbac.org>

Contents:

Introduction
 History
 Motivation
 Design Goals
 Overview of RSBAC

2 Architecture and Implementation of the Framework

5 Online Ressources

6 New in 1.2.0

1.1 History1.2 Motivation1.3 Design Goals1.4 Overview of RSBAC

1.1 Introduction: History

RSBAC Project started as Master Thesis in November 1996

First public RSBAC version 0.9 for Linux kernel 2.0.30 on January, 9, 1998

Current stable release 1.2.0 for kernels 2.2.20 and 2.4.18

1.2.0 with many changes against 1.1.2

1.2+3 Introduction: Motivation and Goals

Classic Linux/Unix Access Control is insecure

- Small Granularity
- Discrete Control
- Trusted user?
- Malware: Invitation to Trojans and Viruses
- Superuser root
- Full Access
- Too often needed
- Too many exploits (root kits, kernel module attacks etc.)

Better models for other protection goals

Flexible Model selection and combination

Good portability

1.4 Introduction: Overview

Based on GFAC by Abrams and LaPadula

Open Source with GPL

Flexible structure

Separation between enforcement (AEF), decision (ADF) and access

control information (ACI)

- Only AEF and part of ACI system dependent
- Almost any type of model supportable
- Model independent -> meta policy

Runtime Module Registration (REG)

1.4 Introduction: Overview II

Powerful logging system

- Request and decision based
- User based
- Program based
- Object based

Stable production use since March 2000

Support for current Linux kernels, ports to other systems likely

Two Linux distributions with RSBAC: ALTLinux Castle and Kaladix

2 Architecture and Implementation of the Framework

2.1 Subjects, Objects and Requests2.2 List of Requests with Targets2.3 Architectural Diagram2.4 Module Registration (REG)

2.1 Architecture: Subjects, Objects and Requests

■ Subjects:

Processes acting on behalf of users

Object types (target types):

- FILE
- DIR
- FIFO
- SYMLINK
- DEV (devices by block/char and major:minor)
- IPC (Inter Process Communication)
- SCD (System Control Data)
- USER
- PROCESS
- NETDEV (new in 1.2.0: Network Devices)
- NETTEMP (new in 1.2.0: Network Object Templates)
- NETOBJ (new in 1.2.0: Network Objects (Sockets etc.))

2.1 Architecture: Subjects, Objects and Requests II

Requests:

Abstraction of what a subject wants to do with an object

2.2 Architecture: List of Requests with Targets

- R_ADD_TO_KERNEL: NONE
- **R_ALTER:** IPC
- R_APPEND_OPEN: FILE, FIFO, DEV, IPC
- R_CHANGE_GROUP: FILE, DIR, FIFO, IPC, USER, PROCESS, NONE
- **R_CHANGE_OWNER:** FILE, DIR, FIFO, IPC, PROCESS, NONE
- **R_CHDIR:** DIR
- **R_CLONE:** PROCESS
- R_CLOSE: FILE, DIR, FIFO, DEV, IPC, NETOBJ
- **R_CREATE:** DIR (where), IPC, NETTEMP, NETOBJ
- **R_DELETE:** FILE, DIR, FIFO, IPC, NETTEMP
- **R_EXECUTE:** FILE
- **R_GET_PERMISSIONS_DATA:** FILE, DIR, FIFO, IPC, SCD
- R_GET_STATUS_DATA: FILE, DIR, FIFO, SYMLINK, IPC, SCD, NETDEV
- **R_LINK_HARD:** FILE, FIFO
- R_MODIFY_ACCESS_DATA: FILE, DIR, FIFO
- **R_MODIFY_ATTRIBUTE:** All target types
- R_MODIFY_PERMISSIONS_DATA: FILE, DIR, FIFO, IPC, SCD, NONE
- R_MODIFY_SYSTEM_DATA: SCD, NETDEV

2.2 Architecture: List of Requests with Targets II

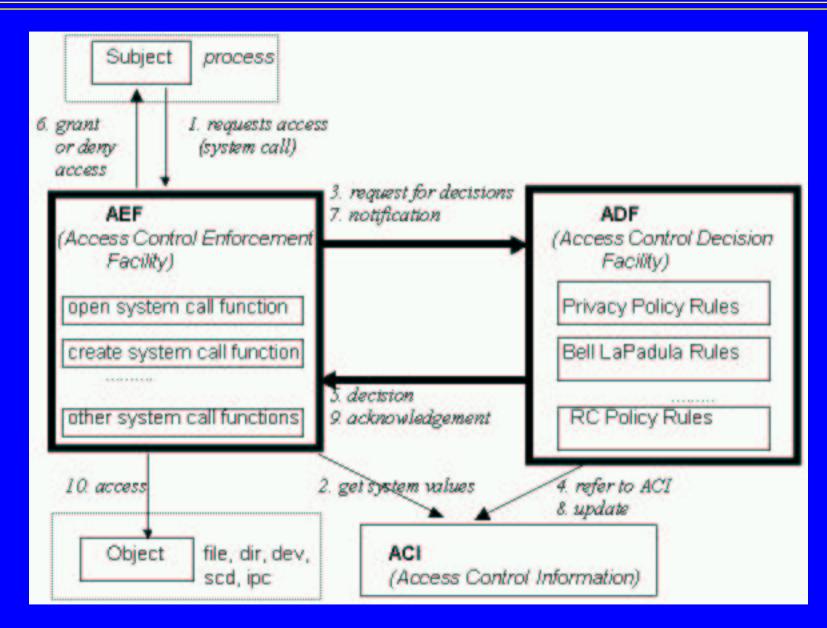

R_MOUNT: DIR, DEV **R_READ:** DIR, SYMLINK, IPC, NETTEMP (optional: FILE, FIFO, DEV, NETOBJ) R_READ_ATTRIBUTE: All target types R READ OPEN: FILE, FIFO, DEV, IPC R_READ_WRITE_OPEN: FILE, FIFO, DEV, IPC R REMOVE FROM KERNEL: NONE **R_RENAME:** FILE, DIR, FIFO **R_SEARCH:** DIR, FIFO **R SEND SIGNAL:** PROCESS **R SHUTDOWN:** NETOBJ, NONE **R_SWITCH_LOG:** NONE **R_SWITCH_MODULE:** NONE **R_TERMINATE:** PROCESS (notify only) **R TRACE:** PROCESS **R_TRUNCATE:** FILE **R_UMOUNT:** DIR, DEV, NONE **R_WRITE:** DIR, SCD, NETTEMP (optional: FILE, FIFO, DEV, NETOBJ) **R_WRITE_OPEN:** FILE, FIFO, DEV, IPC

2.2 Architecture: List of Requests with Targets III

(New in 1.2.0) **R_MAP_EXEC:** FILE, NONE **R_BIND:** NETOBJ **R_CONNECT:** NETOBJ **R_LISTEN:** NETOBJ **R_ACCEPT:** NETOBJ **R_SEND:** NETOBJ

R_RECEIVE: NETOBJ

2.3 Architectural Diagram

2.4 Module Registration (REG)

Runtime registration of decision functions (Rule Sets) and system calls

Model implementation e.g. as kernel module

Add or remove models, syscalls or generic (persistent) lists in a running system

Easy control of module removal by the module itself

Sample modules provided

3 Implemented Models

3.1 MAC, FC and SIM
3.2 PM, MS and FF
3.3 AUTH
3.4 RC
3.5 ACL
3.6 CAP

3.1 Models: MAC, FC and SIM

Mandatory Access Control (MAC):

- Bell-LaPadula
- 253 security levels
- 64 categories
- Automatic adjustment of current_sec_level and current_categories via mac_auto with boundaries

Functional Control (FC):

- Simple role model
- User, Security Officer, System Administrator
- Object Categories: General, Security, System

Security Information Modification (SIM)

- Even simpler role model
- User and Security Officer
- Object Types: None, Security Information

3.2 Models: PM, MS and FF

Privacy Model by Simone Fischer-Hübner (PM):

- Complex model conforming to EU privacy laws
- Object Classes, Purposes, Tasks, Necessary Accesses, ...

■Malware Scan (MS):

- On-Access Malware Scanner
- File and socket accesses
- Scan status: unscanned, rejected, accepted-with-level
- Prototype only few viruses detected
- Plug-In interface for better scanning engines

■ File Flags (FF):

- Inheritable FILE, DIR, FIFO and SYMLINK attributes
- e.g. read-only, no-execute, secure-delete

3.3 Models: AUTH

Authentication (AUTH):

- Restriction of CHANGE_OWNER with target PROCESS (setuid)
- CHANGE_OWNER capabilities (inherited from file to process)
- auth_may_setuid and auth_may_set_cap
- Daemon based authentication enforcable

3.4 Models: RC

Role Compatibility (RC):

 Unlimited roles and types, types grouped per target type (file, dir, fifo, symlink together)

Compatibility of roles

- with object types
- with other roles (change role)
- in request granularity

Forced and Initial Roles based on program files

Separation of Administration Duties

- Separate sets of roles
- Admin Roles
- Assign Roles
- Additional access rights: Admin, Assign, Access Control, Supervisor

3.5 Models: ACL

Access Control Lists (ACL)

- What subject may access which object with which requests
- Subjects:
- RC roles (!)
- Users
- ACL Groups
- ACL Groups:
- All users can have individual groups
- Private and global groups
- Inheritance with masks (similar to Netware 3.xx)
- Default ACLs on top of hierarchy
- Special Rights:
- Access Control
- Forward
- Supervisor

3.6 Models: CAP

Linux Capabilities:

Minimum and maximum capability sets for users and programs

Applied at CHANGE_OWNER on processes (setuid) and EXECUTE

Precedence of Minimum over Maximum Sets
Precedence of Program over User Sets

Limit rights of root programs or extend rights of normal user programs
E.g. run sendmail from normal user account with DAC_OVERRIDE and NET_BIND_SERVICE

4 Practical Experience

4.1 Running Systems4.2 Stability4.3 Performance

4.1 Practical Experience: Running Systems

Compuniverse Firewall Servers

- Since 2000 with RSBAC (optional in the beginning)
- Strict encapsulation with full usability is possible
- Use of AUTH, FF and RC models
- Software selection for better RSBAC control, e.g. POP3 with separate authentication program

Many systems by other admins (see RSBAC mailing list)

Linux distributions ALTLinux Castle and Kaladix

4.2 Practical Experience: Stability

UP: Very high stability

- no crash yet on my and customer production systems
- no crashes for 1.1.2 reported
- 1.2.0 just released

SMP: High stability

only few problems reported
no outstanding problems for 1.2.0 from pre series

4.3 Practical Experience: Performance

Performance influences

- Number and dynamic change of attribute objects
- Number and type of decision modules
- Logging

Benchmarks

- Celeron 333 system, 2.4.18 kernel, RSBAC 1.2.0-pre6
- Three compile runs of same Linux kernel source each
- Runtime with framework only (Maint Mode): +0.51% (kernel +7.70%)
- Runtime with RC, AUTH, network control: +1.77% (kernel +25.22%)
- Runtime with REG, FF, RC, AUTH, ACL, CAP, network control (def. config): +4.52% (kernel +88.37%)

5 Online Ressources

RSBAC Homepage: http://www.rsbac.org

Mailing List

- Requests: rsbac-request@rsbac.org
- Mails: rsbac@rsbac.org
- Archive available (see contact page)

<u>6 New in 1.2.0</u>

User ID and RC role based symlink redirection support

Network Device (NETDEV) targets (for configuration and raw access)

Real template based network access control
 Network Object (Socket) templates (NETTEMP) and targets (NETOBJ)
 New requests BIND, CONNECT, etc.

CAP module with min and max Linux Capabilities for users and programs

<u>6 New in 1.2.0 II</u>

Network and firewall config protection as new SCD targets

Unlimited roles and types in RC model

Separate request type MAP_EXEC for library mapping (used to be EXECUTE, too)

Lifetime limites for many RC and ACL settings, i.e. access rights

Rule Set Based Access Control (RSBAC)

Linux Kernel Security Extension
